Module Risk Assessment

Overall Risk Score: 4/10

Confidence: High - The PyTorch predictive model achieves $R^2 = 0.9998$ with $MAPE < 0.01\%$, the overall module average is 86.51 (well above critical thresholds), no CHAID high-risk metrics were identified, no dependent inconsistencies were detected at any level, and the Average MSE across models is 8.71×10^{-6} , confirming strong statistical reliability across all sub-modules.

Trend: Stable-to-Deteriorating (mixed signals - several metrics trending Decreasing across Environmental, Regulatory, Audit, and ERM sub-modules, offset by Increasing trends in Social, Policy, and Governance sub-modules)

Top Risk Areas

Risk 1: Critical Process Control Signals in Environmental & Green Sourcing Metrics

- **Description:** Three metrics - ESU10106 (Green Sourcing Metric), SSU10106 (Employee Turnover Rate), and GNT10106 (Compliance Reminder Effectiveness) - each carry an elevated Risk Priority Number (RPN = 70) driven by **2 SPC signals each**, the highest signal count in the entire module. ESU10106 is simultaneously trending Decreasing and exhibits a dominant Fourier period of 23.44 units, suggesting a cyclical deterioration pattern rather than random noise. These metrics sit at the bottom of the low-performing metrics list at a score of 65 - the lowest absolute values in the module.
 - **Evidence:**
 - `metrics_summary.txt / rpn_summary.txt`: ESU10106 (RPN=70, signals=2, mean=86.59, LCL=65.53), SSU10106 (RPN=70, signals=2, mean=86.55, LCL=65.15), GNT10106 (RPN=70, signals=2, mean=86.39, LCL=65.31)
 - `low_performing_entities_report_esgrc.txt`: All three metrics score 65 - tied for last place across all metrics in the module
 - `trends_and_repetitions_report_esgrc.txt`: ESU10106 trend = **Decreasing**, dominant period = 23.44 units; GNT10106 trend = Increasing (diverging from expected direction given low score); SSU10106 trend = Stable
 - `ESGRC_Module_model_summary.txt`: Scenario_10 (Avg Risk = 0.960, highest scenario risk) is driven in part by CGS10106 (Say-on-Pay Approval % = 65), signalling that metrics at the 65-score floor are concentrated in the highest-risk scenario
 - **Recommended Action:** Initiate a targeted Root Cause Analysis (RCA) for ESU10106 and GNT10106 within **30 days**, focusing on supplier qualification processes and compliance communication cadence respectively. Implement weekly SPC monitoring dashboards for all three metrics with escalation triggers at any further signal detection. Set a remediation target of ≥ 75 for all three metrics within **90 days**, with interim checkpoint reviews at Day 45.
-

Risk 2: Highest Predictive Risk Scenario Concentration in Corporate Governance & Regulatory Sub-Modules

- **Description:** The model's highest-risk scenario (Scenario_10, Avg Risk = 0.960) is driven by CGS10106 (Say-on-Pay Approval %), CGS10104 (Executive Compensation Group, score = 73.5), and REG10000 (Regulatory Compliance sub-module, score = 80.83). The Executive Compensation Group (CGS10104) is among the 10 lowest-performing groups in the module, and Regulatory Compliance (REG10000) is itself a low-performing sub-module. This concentration indicates that governance pay practices and regulatory compliance posture represent a compounding, systemic risk cluster - not isolated metric failures.
- **Evidence:**
 - ESGRC_Module_model_summary.txt: Scenario_10 Avg Risk = **0.960**, highest of all 10 scenarios; key drivers: CGS10106, CGS10104, REG10000
 - low_performing_entities_report_esgrc.txt: CGS10104 (Executive Compensation Group) score = **73.5** (9th lowest group); REG10000 (Regulatory Compliance) score = **80.83** (6th lowest sub-module); CGS10106 (Say-on-Pay Approval %) score = **65** (lowest metric tier)
 - rpn_summary.txt: CGS10106 RPN = 35 with 1 SPC signal; CGV10106 (Committee Charter Compliance) also RPN = 35 with 1 signal, reinforcing governance-wide control weakness
 - trends_and_repetitions_report_esgrc.txt: REG10000 trend = **Decreasing**; multiple REG metrics decreasing (REG10102, REG10103, REG10106, REG10108, REG10109)
 - M_G_SM_correlation_report_esgrc.txt (Sub-modules): GRC10000 <-> REG10000 correlation = **0.031** - near independence, indicating these two governance risk areas are not self-correcting each other
- **Recommended Action:** Convene a Board Governance and Compensation Committee review within **45 days** to assess say-on-pay alignment with performance benchmarks. Initiate a regulatory compliance gap analysis across REG10102-REG10109 metrics within **30 days**, prioritising the five decreasing-trend metrics. Assign a dedicated Regulatory Compliance Officer accountability to each decreasing REG metric with quarterly KPI reviews and a target of returning REG10000 to >=85 within **180 days**.

Risk 3: Systemic Audit and ERM Sub-Module Performance Deterioration

- **Description:** The Audit sub-module (AUD10000, score = lowest in the report at implied performance relative to its peer group) and Enterprise Risk Management sub-module (ERM10000) are both trending **Decreasing**, with multiple constituent metrics also declining. Six of the eight tracked AUD metrics (AUD10102, AUD10105, AUD10106) are on decreasing trends, and four ERM metrics (ERM10105, ERM10106, ERM10108, ERM10109) are simultaneously decreasing. The low-performing group GRC10105 (Compliance Monitoring Group, score = 72.0 - the lowest-performing group in the entire module) directly feeds into this risk cluster.
- **Evidence:**
 - low_performing_entities_report_esgrc.txt: GRC10105 (Compliance Monitoring Group) = **72.0** - the single lowest-performing group across all sub-modules
 - trends_and_repetitions_report_esgrc.txt: AUD10000 trend = **Decreasing**; ERM10000 trend = **Decreasing**; AUD10102, AUD10105, AUD10106 all = Decreasing; ERM10105, ERM10106, ERM10108, ERM10109 all = Decreasing
 - ESGRC_Module_model_summary.txt: Scenario_8 (Avg Risk = 0.640, third highest) driven by AUD10109 (Management Satisfaction Score) and ERM10103 (Risk Mitigation Cost Efficiency) - confirming these sub-modules are predictive risk drivers
 - rpn_summary.txt: AUD10105 (High-Risk Findings Count) RPN = 35, AUD10106 (Remediation Timeliness) RPN = 35 - both with 0 signals but decreasing trends, indicating emerging risk not yet triggering SPC alarms
 - M_G_SM_correlation_report_esgrc.txt (Sub-modules): ERM10000 <-> AUD10000 correlation = **0.013** - essentially uncorrelated, meaning audit and risk management functions are operating independently rather than in a mutually reinforcing control loop
- **Recommended Action:** Implement a mandatory AUD-ERM integration review within **60 days** to evaluate whether audit findings are feeding ERM risk registers in a timely manner (addressing the near-zero

cross-correlation). Establish a Compliance Monitoring Group (GRC10105) remediation plan with a target score of ≥ 80 within **120 days**, including monthly progress reviews. Introduce automated escalation for AUD10106 (Remediation Timeliness) when any audit finding exceeds agreed closure timelines, with a target of reducing High-Risk Findings (AUD10105) by 20% within **90 days**.

Risk 4: Environmental Sub-Module Leading the Low-Performance Rankings with Instability Signals

- **Description:** ESU10000 (Environmental & Sustainability Unit) is the single lowest-performing sub-module in the entire ESGRC module with a score of **74.0**, and it is simultaneously trending **Decreasing** with **no clear Fourier repetition pattern** - a combination that the Fourier analysis flags as "potential instability." This combination of lowest sub-module score + decreasing trend + instability signal represents the most acute single-entity performance risk in the module. The Climate Risk Group (ESU10108, score = 72.5) is the second-lowest performing group overall, amplifying the environmental risk cluster.
 - **Evidence:**
 - low_performing_entities_report_esgrc.txt: ESU10000 = **74.0** - the #1 lowest-performing sub-module; ESU10108 (Climate Risk Group) = **72.5** - #2 lowest-performing group overall
 - trends_and_repetitions_report_esgrc.txt: ESU10000 trend = **Decreasing**; ESU10000 Fourier = **"No clear repetition (potential instability)"**; ESU10107 (Renewable Energy Usage) trend = Decreasing; ESU10105 (Climate Risk Group's parent group) trend = Decreasing; ESU10102 Fourier = "No clear repetition (potential instability)"; ESU10107 Fourier = "No clear repetition (potential instability)"; ESU10110 Fourier = "No clear repetition (potential instability)"
 - rpn_summary.txt: ESU10104 (Resource Efficiency Index) RPN = 35 with 1 SPC signal; ESU10110 (Physical Risk Assessment) RPN = 35 with 1 SPC signal - both at the 65-score floor
 - low_performing_entities_report_esgrc.txt: ESU10104 (Resource Efficiency Index) and ESU10106 (Green Sourcing Metric) both score **65** - lowest possible observed values in the dataset
 - Overall module average = **86.51**; ESU10000 at 74.0 represents a **12.51-point deficit** below module average, the largest gap of any sub-module
 - **Recommended Action:** Conduct an Environmental Performance Review Board meeting within **30 days** to identify root causes of the ESU10000 instability pattern. Assign specific ownership to ESU10107 (Renewable Energy Usage) and ESU10104 (Resource Efficiency Index) with monthly KPI reporting to senior leadership. Develop a Climate Risk Remediation Roadmap targeting ESU10108 (Climate Risk Group) score improvement from 72.5 to ≥ 80 within **180 days**, with quarterly milestone checkpoints. Engage external ESG benchmarking within **60 days** to contextualise performance against industry peers.
-

Risk 5: Broad Information Governance and Cybersecurity Group Underperformance

- **Description:** Four additional sub-modules - General Notes & Training (GNT10000, 76.75), Social & Safety Unit (SSU10000, 78.33), Cybersecurity Unit (CSU10000, 78.33), and Information Governance (IGV10104, 73.5 as a group) - all register below the module average, with several constituent groups showing scores in the 73-74 range. The Data Protection Group (CSU10104, 73.5) and Workforce Practices Group (SSU10104, 73.5) are tied for the 4th-lowest group scores, indicating that fundamental data security and people management capabilities require coordinated attention.
- **Evidence:**
 - low_performing_entities_report_esgrc.txt: SSU10104 (Workforce Practices Group) = **73.5**; CSU10104 (Data Protection Group) = **73.5**; GNT10104 (Internal Communication Group) = **73.5**; IGV10104 (Record Management Group) = **73.5** - all tied for 4th lowest group score
 - low_performing_entities_report_esgrc.txt (Sub-modules): GNT10000 = **76.75** (#2 lowest sub-module); SSU10000 = **78.33** (#3 tied); CSU10000 = **78.33** (#3 tied)

- trends_and_repetitions_report_esgrc.txt: IGV10105 (Retention Policy Compliance) = Decreasing; IGV10102 (Data Accuracy Rate) = Decreasing; CSU10105 (Data Encryption Compliance) = Decreasing; CSU10106 (Access Control Audit Score) = Decreasing
- rpn_summary.txt: CSU10106 (Access Control Audit Score) RPN = 35 with 1 SPC signal - cybersecurity access control is generating process control signals while also scoring 65 (at the low-performance floor)
- inconsistencies_report_esgrc.txt: Extensive metric-level independent inconsistencies across CSU, IGV, and SSU metrics confirm these sub-modules operate with high internal variability rather than systematic coherence
- **Recommended Action:** Establish a cross-functional Data Governance and Workforce Risk Task Force within **45 days** encompassing CSU, IGV, and SSU leadership. Prioritise remediation of CSU10106 (Access Control Audit Score) through an immediate access control audit and remediation sprint within **30 days**. Set a group-level performance target of ≥ 80 for all four 73.5-scoring groups within **120 days**, tracked through monthly governance reviews. Implement an Information Governance maturity assessment within **60 days** to identify structural capability gaps in IGV10104 (Record Management Group).

Low-Performing Sub-Modules

None identified below a score of 50. All sub-modules in the ESGRC module operate above the critical 50-point threshold. However, the following sub-modules are flagged as materially below the module average (86.51) and warrant heightened monitoring:

Rank	Sub-Module ID	Sub-Module Name	Score	Gap vs. Module Avg
1	ESU10000	Environmental & Sustainability Unit	74.0	-12.51
2	GNT10000	General Notes & Training	76.75	-9.76
3	SSU10000	Social & Safety Unit	78.33	-8.18
3	CSU10000	Cybersecurity Unit	78.33	-8.18
5	GRC10000	Governance, Risk & Compliance	80.78	-5.73

Summary

The ESGRC module presents a **moderate overall risk profile (4/10)** characterised by no catastrophic failures but a persistent cluster of underperforming entities concentrated in Environmental, Audit, ERM, and Governance sub-modules. The most acute immediate concerns are the three metrics at the module's performance floor (score = 65) carrying the highest RPN signals (ESU10106, SSU10106, GNT10106), and the predictive model's identification of a near-certain high-risk scenario (Scenario_10, 0.960 probability) driven by corporate governance pay practices and regulatory compliance weakness. Strategic remediation priority should be given to the Environmental & Sustainability Unit (ESU10000, score 74.0 - the module's weakest sub-module with a decreasing trend and instability pattern), the Compliance Monitoring Group (GRC10105, score 72.0 - the module's weakest group), and the integrated AUD-ERM control loop, where near-zero cross-correlation indicates a systemic disconnect between audit findings and enterprise risk management responses.
